

# PRO100

**PRO100** is designed for manufacturers of purpose made furniture products, such as kitchen units, bathroom vanity units and wardrobes. PRO100 is an extremely user-friendly, feature rich, 3D interior and furniture design program. Pure **woodworking and furniture software**, Pure **kitchen design software** ... not just another CAD application.

**PRO100** is a completely independent application. Working with the program is like designing a real room and creating real furniture. The user operates on furniture items, arranging them in the virtual space as if they were real. You can create your own furniture catalogues, appliances and materials or take advantage of the catalogues included in the program. PRO100 is an all-purpose tool for producers and designers of any kind of furniture.

The designed interior can be seen from seven different views (including the perspective view). In each view the program can automatically show the dimensions of the interior. There are five view modes: wire frame, sketch, colours, textures and full, photo-realistic visualization. In each mode you can switch on different effects, such as semi-transparency, contours or shading.

All changes are immediately reflected in all modules of the program, including parts list, material calculations and all visualization modes. Arranging a room takes less than 20 minutes. At each stage of your work you can freely modify all modules, add and remove handles, shelves or whole furniture items and change colours of the entire project or a part of it with just a single mouse click. These are just some of the features that make **PRO100** the perfect tool to work with.
